

Your Decision for Precision

Filling glass capillary tubes used to be a time consuming and tedious part of the job.

With the Capillary Boy this is now part of the past.

Never before filling capillary tubes was so convenient.

You mount your capillary tube on an oscillator. The vibrations cause the powder to drop down gently. Simply by turning one knob you can regulate the frequency of the oscillator to match the needs for each capillary tube/powder combination. This reduces the length of the procedure to an average of less than 1 to 2 minutes, depending on the powder.

Capillary Boy 670.21

- Hassle-free filling your capillary tubes
- Break less capillary tubes
- Reduce your cost per analysis
- Save up to 15 minutes for each capillary tube you fill

The Capillary Boy:

- Portable
- Works on a standard 9V battery
- Weighs less than 1 kg
- Can be used inside a glove box
- Variable frequency
- Easily tune the frequency for each specimen
- Control the velocity and direction of the particles in your powder

About the supplier

About AJK Analytical Services :
AJK Analytical Services, the X-ray community services and consultancy company organises scheduled courses in x-ray analysis techniques, on-site training in X-ray analysis techniques and helps in choosing the most suitable X-ray analysis equipment in the market for your application. Moreover, on-line support in X-ray diffraction and X-ray fluorescence spectrometry is part of the company's portfolio as well as on-site installation support.

This is the solution to save time and money
